Cut the sticks

You are given \$N\$ sticks, where the *length* of each stick is a positive integer. A *cut operation* is performed on the sticks such that all of them are reduced by the length of the smallest stick.

Suppose we have six sticks of the following lengths:

544228

Then, in one *cut operation* we make a cut of length 2 from each of the six sticks. For the next *cut operation* four sticks are left (of non-zero length), whose lengths are the following:

3226

The above step is repeated until no sticks are left.

Given the length of \$N\$ sticks, print the number of sticks that are left before each subsequent *cut* operations.

Note: For each *cut operation*, you have to recalcuate the length of smallest sticks (excluding zero-length sticks).

Input Format

The first line contains a single integer \$N\$.

The next line contains \$N\$ integers: a_0 , a_1 ,... a_{N-1} separated by space, where a_i represents the length of i^{th} stick.

Output Format

For each operation, print the number of sticks that are cut, on separate lines.

Constraints

 $1 \le N \le 1000$

 $1 \le a_i \le 1000$

Sample Input #00

6 5 4 4 2 2 8
